

## Individuals with obesity: data extraction and appraisals

### Search results for 2019 International Pressure Injury Guideline: Individuals with obesity

\* Recommendations related to all special populations are included in the topics to which the recommendation relates (e.g. support surfaces), and the references supporting these recommendations are included in the search reports for those topics.

European Pressure Ulcer Advisory Panel, National Pressure Injury Advisory Panel and Pan Pacific Pressure Injury Alliance. *Prevention and Treatment of Pressure Ulcers/Injuries: Clinical Practice Guideline. The International Guideline.* Emily Haesler (Ed.). EPUAP/NPIAP/PPPIA; 2019

# Individuals with obesity: data extraction and appraisals

## Articles Reviewed for International Pressure Injury Guideline

The research has been reviewed across three editions of the guideline. The terms pressure ulcer and pressure injury are used interchangeably in this document and abbreviated to PU/PI. Tables have not been professionally edited. Tables include papers with relevant direct and indirect evidence that were considered for inclusion in the guideline. The tables are provided as a background resources and are not for reproduction.

## Individuals with obesity: data extraction and appraisals

**Table 1: Level of Evidence for Intervention Studies**

<b>Level 1</b>	<b>Experimental Designs</b> <ul style="list-style-type: none"> <li>• Randomized trial</li> </ul>
<b>Level 2</b>	<b>Quasi-experimental design</b> <ul style="list-style-type: none"> <li>• Prospectively controlled study design</li> <li>• Pre-test post-test or historic/retrospective control group study</li> </ul>
<b>Level 3</b>	<b>Observational-analytical designs</b> <ul style="list-style-type: none"> <li>• Cohort study with or without control group</li> <li>• Case-controlled study</li> </ul>
<b>Level 4</b>	<b>Observational-descriptive studies (no control)</b> <ul style="list-style-type: none"> <li>• Observational study with no control group</li> <li>• Cross-sectional study</li> <li>• Case series (n=10+)</li> </ul>
<b>Level 5</b>	<b>Indirect evidence:</b> studies in normal human subjects, human subjects with other types of chronic wounds, laboratory studies using animals, or computational models

**Table 2: Levels of evidence for diagnostic studies in the EPUAP-NPUAP-PPPIA guideline update**

<b>Level 1</b>	Individual high quality (cross sectional) studies according to the quality assessment tools with consistently applied reference standard and blinding among consecutive persons.
<b>Level 2</b>	Non-consecutive studies or studies without consistently applied reference standards.
<b>Level 3</b>	Case-control studies or poor or non-independent reference standard.
<b>Level 4</b>	Mechanism-based reasoning, study of diagnostic yield (no reference standard).

**Table 3: Levels of evidence for prognostic studies in the EPUAP-NPUAP-PPPIA guideline update**

<b>Level 1</b>	A prospective cohort study.
<b>Level 2</b>	Analysis of prognostic factors amongst persons in a single arm of a randomized controlled trial.
<b>Level 3</b>	Case-series or case-control studies, or low quality prognostic cohort study, or retrospective cohort study.

### APPRAISAL FOR STUDIES PROVIDING DIRECT EVIDENCE (i.e. ELIGIBLE FOR SUPPORTING AN EVIDENCE-BASED RECOMMENDATIONS)

Each criteria on the critical appraisal forms was assessed as being fully met (Y), partially met or uncertain (U), not met/not reported/unclear (N), or not applicable (NA). Studies were generally described as high, moderate, or low quality using the following criteria:

- High quality studies: fully met at least 80% of applicable criteria
- Moderate quality studies: fully met at least 70% of applicable criteria
- Low quality studies: did not fully meet at least 70% of applicable criteria

## Individuals with obesity: data extraction and appraisals

### PROGNOSTIC STUDIES INCLUDING RISK FACTORS

	Author/year	Adequate description of baseline characteristics	Satisfactory study attrition	Clear outcome measures/prognostic factors	Range of prognostic factors/confounders measured identified and	Method of measuring prognostic factor is reported, valid and reliable	Same method of measure of prognostic factor for all	Continuous variables or appropriate cut offs	Percent participants with complete data acceptable	Appropriate imputation method	Confounders/prognostic factors accounted for in analysis	Selective reporting avoided	Adequate sample size (10 PIs per factor)	Level of evidence	Quality
2962	Hyun et al., 2014	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Level 3 (prognostic)	High

### QUASI EXPERIMENTAL STUDIES

	Author/year	Focused question	Subjects and investigators blinded	Groups comparable at commencement	Only difference btw groups was treatment	Valid, reliable outcome measurement	Per cent drop out in study arms is reported and acceptable	Intention to treat analysis	Comparable results for multiple sites	Minimal bias	Reliable conclusions	Level of evidence	Quality
6133	Walden et al., 2013	Y	N	Y	U	U	N	Y	NA	N	N	2	Low
